

# Sorting

Sorting is an essential activity in Data Processing  
e.g. In Binary Search the array is sorted

The methods for Sorting depend on

Data Structures -- arrays, lists, files

The data structures may be stored internally or externally.

## Internal:

Sorting is done in memory; this gives fast access to the items e.g. arrays

Consideration is also given as to whether the sorting is done in-place or not. An in-place sort of a sequence of  $n$  items uses a constant amount of extra space. The following algorithm for sorting is not in-place

Algorithm:

Copy smallest item to 1st position in another array,  
copy next smallest to 2nd position  
etc.

**We will be concerned with in-place sorting of arrays.**

## External:

The sequence to be sorted is stored externally on files e.g. disk or tape.

**Performance --  $O(n^2)$  .v.  $O(n * (\log n))$**

Algorithms for sorting can be classified according to whether they are

$O(n^2)$  -- Elementary/Simple sorts or

$O(n \log n)$  -- Advanced/Sophisticated sorts

Sort algorithms can be grouped according to strategies;

- |                    |   |
|--------------------|---|
| 1. Insertion: e.g. | Insert sort -- $O(n^2)$<br>Merge sort -- $O(n * (\log n))$        |
| 2. Selection: e.g. | Select sort -- $O(n^2)$<br>Heapsort/Treesort -- $O(n * (\log n))$ |
| 3. Exchange: e.g.  | Bubble/Exchange -- $O(n^2)$<br>Quicksort -- $O(n * (\log n))$     |

A sort like Shell Sort is difficult to classify even though it may be considered an Insertion sort but it is neither  $O(n^2)$  nor  $O(n \log n)$ .

Also, Select sort may be thought of as a worst case of Quicksort.

## Other considerations

- the data may be stored in sophisticated data structures e.g. Binary Trees or Priority Queues.
- the sort should be stable, i.e. the relative order of equal items is unchanged.
- The sort should be Natural, i.e. it sorts almost sorted sequences best.

## Order of Execution Time -- the $O(n)$ notation

Let  $f(n)$  and  $g(n)$  be two functions. We say that  $f(n)$  is (no more than) Order  $g(n)$ , written  $O(g(n))$ , if there exists  $c > 0$  s.t. for all (except maybe a finite number) naturals  $n$

$$f(n) \leq c \cdot g(n)$$

We say  $f(n)$  is proportional to  $g(n)$  iff  $f(n)$  is  $O(g(n))$  and  $g(n)$  is  $O(f(n))$  i.e. they are the same order.

**e.g. 1**

$$f(n) = n+5; \quad g(n) = n$$

$$\text{then } O(f(n)) = O(g(n))$$

To show  $f(n)$  is  $O(g(n))$ , choose  $c = 5$

$$f(n) = n+5 \leq 5 \cdot n = c \cdot g(n), \quad n > 1$$

To show  $g(n)$  is  $O(f(n))$ , choose  $c=1$

$$g(n) = n \leq n+5 = c \cdot f(n)$$

**e.g. 2**

Is  $3^n$   $O(2^n)$ ?      No!

Suppose  $\exists$  ("there exists")  $n_0, k$  s.t. for all  $n \geq n_0$ ,  $3^n \leq c \cdot 2^n$

Then  $c \geq \left(\frac{3}{2}\right)^n$  for any  $n \geq n_0$

This is impossible as  $\left(\frac{3}{2}\right)^n$  gets arbitrarily large.

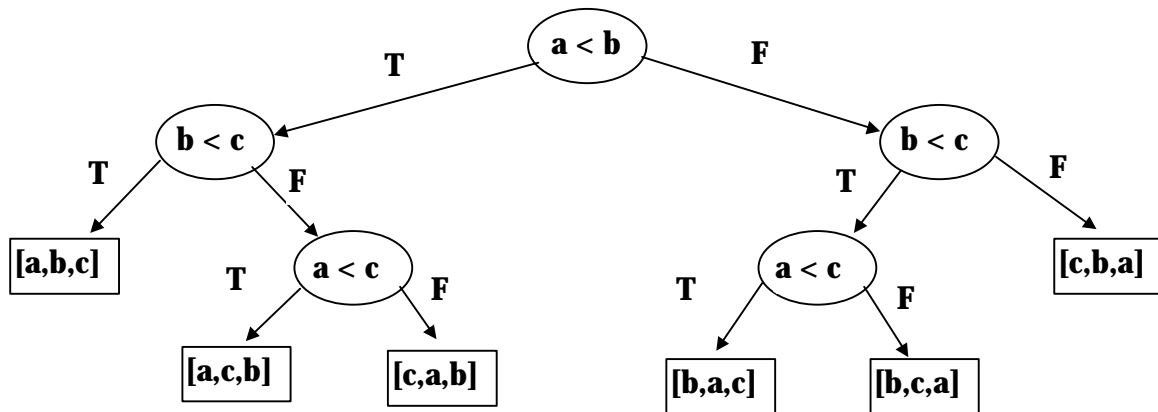

### ***Theoretical Optimum for Sorting.***

This assumes we are using binary comparison. The optimal number of comparisons is  $O(n \cdot \log n)$ .

Assume the sequence has  $n$  distinct elements.

e.g.  $n = 3$

$s$  has values  $a, b, c$ . Let use the notation  $[a, b, c]$  for the sequence  $s$ .

Height of Binary Tree with  $k$  leaves =  $\lceil \log k \rceil$  “ceiling(log  $k$ )”

tf.

#Comparisons  $\geq \log n!$

but  $\log n! = \log n + \log (n-1) + \dots + \log 2$

tf.

$\log n!$  is  $O(n \cdot \log n)$

# Sequence

From mathematics, a sequence of  $n$  items of type  $T$  is a function from  $\text{Nat}_n$  to  $T$ .

e.g.  $x : \text{Nat}_n \rightarrow \text{Real}$

$$k \mapsto x(k)$$

where  $\text{Nat}_n = \{1, 2, \dots, n\}$

We can use the notation

$$[x(1), \dots, x(n)] \quad \text{or} \quad [x_1, \dots, x_n]$$

to denote the sequence  $x$ .

## *Permutation of a Sequence*

Let  $X, Y$  be 2 sequences, then define

$\text{Perm}(X, Y)$  “ $Y$  is a Permutation of  $X$ ”

$\equiv \exists$  a bijective function  $p$  on  $\text{Nat}_n$  s.t.  $Y = [x(p(1)), x(p(2)), \dots, x(p(n))]$

e.g. Let  $X$  and  $Y$  be sequence of characters where  $X = [a, a, b]$  and  $Y = [a, b, a]$

tf.  $\text{Perm}([a, a, b], [a, b, a])$

$$\text{Let } p = \begin{pmatrix} 1 & 2 & 3 \\ 1 & 3 & 2 \end{pmatrix}$$

$$\begin{aligned} [a, b, a] &= [x(1), x(3), x(2)] \\ &= [x(p(1)), x(p(2)), x(p(3))] \end{aligned}$$

## *Another Defn of Perm(L, M)*

Def<sup>n</sup>: **Bag or Suite**

A bag is a multi-set, i.e. a ‘set’ with repeated elements. More precisely, if  $B$  is a bag of elements of type  $T$  then

$$\begin{aligned} B : T &\rightarrow \text{Nat} \\ t &\mapsto B(t), \end{aligned}$$

where  $B(t)$  is the number of occurrences of  $t$  in  $B$ .

e.g. 1 Let  $T$  be the type CHARACTER and

$$B = \{a, a, c, a, c\}$$

then  $B(a) = 3, B(b) = 0, B(c) = 2$  and  $B(x) = 0$ , for other  $x : T$

e.g. 2 Let  $T$  be the digits  $0 \dots 9$  then

and  $B = \{ 1, 5, 2, 3, 9, 9, 0, 2, 5 \}$

$B(0) = 1, B(1) = 1, B(2) = 2, B(3) = 1, B(4) = 0,$

$B(5) = 2, B(6) = 0, B(7) = 0, B(8) = 0, B(9) = 2$

## Sequence and Bags/Suites

If  $s$  is a sequence of  $n$  items of type  $T$

i.e.  $s : \text{Nat}_n \rightarrow T$

then  $\text{Bag}(s)$  is the bag of items in  $s$ .

$\text{Bag}(s) : T \rightarrow \text{Nat}_n$

where  $\text{Bag}(s)(t) = \#\{k \in \text{Nat}_n \mid s(k) = t\}$

e.g.  $s : \text{Nat}_n \rightarrow \text{CHARACTER}$

s.t.  $s = [a, b, a]$

then  $\text{Bag}(s) : \text{CHARACTER} \rightarrow \text{Nat}_n$

i.e.  $\text{Bag}(s) = \{a, b, a\}$

We can define  $\text{Bag}(s)$  in terms of a function  $\text{count}(t, s)$  which returns the numbers of occurrences of  $t$  in  $s$ .

More precisely, let  $B = \text{Bag}(s)$ , then  $B : T \rightarrow \text{Nat}_n$

where  $B(t) = \text{count}(t, s)$  i.e.  $\text{Bag}(s)(t) = \text{count}(t, s)$

We define  $\text{count}(t, s)$  recursively,

*Notation:*

Let  $[]$  be the empty sequence, and

let  $t \mathbin{\smallfrown} s$  be 'item  $t$  prepended to sequence  $s$ '

$\text{count} : T \times \text{SEQ}[T] \rightarrow \text{Nat}$

--  $\text{SEQ}[T]$  "sequence of items from  $T$ "

$\text{count}(t, []) = 0$

$\text{count}(t, t \mathbin{\smallfrown} s) = 1 + \text{count}(t, s)$

$\text{count}(t, u \mathbin{\smallfrown} s) = \text{count}(t, s)$ , if  $t \neq u$

**Note:**

We can regard a set  $S$  of elements of  $T$  as

$$S : T \rightarrow \text{BOOLEAN}$$

where  $t \in S \equiv S(t)$

*Equality of Bags*

$$B1 = B2 \text{ as bags}$$

iff  $B1$  and  $B2$  have the same elements with the same occurrences.

$$B1 = B2 \equiv (\text{All } x:T \mid : B1(x) = B2(x))$$

i.e.  $B1 = B2$  as functions.

**Defn #2 Perm(L,M)**

Let  $L$  and  $M$  be sequences of type  $T$ . The sequences  $L$  and  $M$  may have repeated elements.

Let  $\text{Bag}(L)$  be the bag corresponding to  $L$

We define

$$\begin{aligned} \text{Perm}(L,M) &\equiv (\text{All } x:T \mid : \text{count}(x,L) = \text{count}(x,M)) \\ &\equiv \text{Bag}(L) = \text{Bag}(M) \end{aligned}$$

**Def<sup>n</sup> of Sorting a Sequence**

$$M = \text{Sort}(L) \equiv \text{Perm}(L, M) \ \& \ \text{Ordered}(M)$$

where as before,

$$\text{Ordered}(M) = (\text{All } k \mid 1 \leq k < n : M(k) \leq M(k+1))$$

*“Extremely Slow Sort”*

To sort  $L$ , generate all Perms of  $L$  and check which one is Ordered.
