

Maintaining Program State

- ▶ Program State
 - ▶ Register and Memory Contents
 - ▶ Need to save and restore state
 - ▶ When exiting and restarting from Monitor
 - ▶ Leave Memory State as is
 - ▶ Copy CPU register to/from a “save-location”
 - ▶ Collection of saved registers called a “Frame”
- ▶ Where?
 - ▶ Use system stack – easiest place

Monitor Invariant

- ▶ A key property that holds when:
 - ▶ Control returns to Monitor from program
 - ▶ Monitor is about to control to program
 - ▶ User issues a monitor command
- ▶ 1st Version of Invariant
 - ▶ The most recent Frame sits on top of the System Stack.

Exiting to Monitor/ Return to Program

- ▶ To exit to Monitor:
 - ▶ Save all registers on SSP.
 - ▶ Jump to Monitor Command Loop start.
- ▶ To return to Program
 - ▶ Restore register from SSP
 - ▶ Perform **rte** to return

Exiting to Monitor/ Return to Program

- ▶ To exit to Monitor:
 - ▶ Save all registers on SSP.
 - ▶ Jump to Monitor Command Loop start.
- ▶ To return to Program
 - ▶ Restore register from SSP
 - ▶ Perform **rte** to return

Breakpoints

- ▶ Points in program where execution is interrupted and control returned to Monitor.
- ▶ User indicates where breakpoints go.
- ▶ User starts program running.
- ▶ Program returns to Monitor at breakpoint
- ▶ User examines and/or modifies memory
- ▶ User continues program execution
- ▶ and so on...

Breakpoints Mechanism

- ▶ Key Ideas:
 - ▶ Replace breakpoint Instruction Word by a special Breakpoint Service Call.
 - ▶ (Breakpoint "Instruction")
 - ▶ Special Break point Handler
 - ▶ Breakpoint Table:
 - ▶ Address of Instructions
 - ▶ Instruction Words themselves

Maintaining Program State (II)

- ▶ Program State also includes Breakpoint Table
- ▶ Breakpoint "State" indicates if the relevant program instruction have been replaced by breakpoint instructions.
- ▶ Need to clear/set breakpoint "state" when exiting to/restarting from Monitor

Monitor Invariant (II)

- ▶ 2nd version of Invariant
 - ▶ The most recent Frame sits on top of the System Stack
 - ▶ And all breakpoints are removed from the program and the correct instructions replaced.

Exiting to Monitor/Returning to Program (II)

- ▶ To exit to Monitor:
 - ▶ Save all register on SSP
 - ▶ Remove all breakpoints from program
 - ▶ Note EXIT as reason for returning to monitor
 - ▶ Jump to Monitor Command Loop start

Returning to Program

- ▶ To return to program:
 - ▶ Restore registers
 - ▶ If EXIT was reason for program stop:
 - ▶ Clear trace bit, insert breakpoints
 - ▶ If BKPT was reason for program stop:
 - ▶ Set trace bit
 - ▶ Perform **rte** to return

Downloading into Memory

- ▶ We use "Motorola" format
 - ▶ A.k.a. MIKBUG Format, or S-records
- ▶ Standard format:
 - ▶ S T nn x1 x2 ... xk cs
 - ▶ T - type number 0,2,5,8...
 - ▶ nn - number of bytes to come, in hex
 - ▶ x1...xn - k information bytes
 - ▶ cs - checksum
 - ▶ nn = k+1
 - ▶ nn + x1 + ... + xk + cs = \$ff
 - ▶ Precise contents of x1...xk depend on T

Downloading into Memory

- ▶ S-records with T = 2
 - ▶ First 3 bytes of x1..xk are addresses
 - ▶ Remaining bytes are data loaded from that address.
 - ▶ S2 nn a2 a1 a0 d0...dj cs
 - ▶ $K = j + 4$, $nn = j + 5$
 - ▶ Example:
 - ▶ S20900123405060708098D
 - ▶ Loads \$05,\$06,\$07,\$08,\$09 into bytes from address \$1234 onwards.

Reading S2-Records (one)

- ▶ To read an S2-record:
- ▶ Use TPCOM to get each host character
- ▶ Look for 'S' followed by '2'
 - ▶ Echoing all else to terminal until 'S2' seen
- ▶ Once 'S2' seen:
 - ▶ Zero checksum
 - ▶ Read nn bytes (add into checksum)
 - ▶ Subtract 5 from nn
 - ▶ Read a2,a1,a0 (3bytes, adding each into checksum)
 - ▶ Set pointer equal to address

Reading S2-Records (two)

- ▶ For nn times:
 - ▶ Read data byte (add into checksum)
 - ▶ Store byte at pointer, increment pointer
- ▶ Read checksum byte (add into checksum)
- ▶ Warn user if checksum is not equal \$FF

Monitor Commands

- ▶ Help
- ▶ Transparent Link
- ▶ Download Link
- ▶ Examine Memory/Register
- ▶ Change Memory/Register
- ▶ Add/Delete Breakpoints
- ▶ Start/Continue Program Execution

That's all for Part I
